

Mapping Generative AI Literacy in Communication and Language Education (2023–2025)

1 Background and Motivation

- As generative AI (GenAI) tools increasingly reshape educational practices and communicative norms, **GenAI literacy** has become a **key concern** for **language learners, educators, and researchers** (e.g., Ng et al., 2024; Xu et al., 2025).
- Despite growing scholarly attention to GenAI literacy, **the ways in which AI literacy is integrated into research design in language education remain underexplored**.
- Systematic inquiry** is therefore needed to **understand** how **AI literacy** is conceptualized, assessed, and positioned in the study.

2 Research Questions

- How has **GenAI literacy** been **studied** in **language education research** over the past three years (2023–2025)?
- What outcomes have been reported?

3 Methods

- PRISMA
- Databases: LLBA, PsycINFO, ERIC, CMMC
- Search term: “AI literacy”

STUDY SELECTION PROCESS

INCLUSION SCOPE

- AI literacy was a main focus of the study.
- The study was empirical in nature.
- The study examined AI literacy in one or more of the following contexts:
 - language studies, including language learning and teaching;
 - education contexts without a specific subject-area focus, which may still be relevant to language education;
 - communicative practices, such as business communication or journalism.

4 Preliminary Findings

Four Primary Research Strands

Emerging patterns for each themes

- Core components** include technical knowledge, critical evaluation, ethics, and responsible use.
- Definitions are increasingly adapted** to specific language, writing, translation, and communication contexts.
- Many **studies remain conceptual**, with limited empirical validation.

- The **majority** use **quantitative survey methods**, often developing or validating Likert-scale instruments.
- Domain-specific** assessment is still limited but **growing**, especially in L2 writing.

- AI literacy** is treated as an **educator competency**, not only a student competency.
- Interventions** predominantly **target teachers** more than students, suggesting that professional development is a primary concern.
- Findings** point to a **need for** clearer **training**, curriculum **guidance**, and institutional **support**.

- AI literacy is examined as both an instructional outcome and a predictor of other outcomes.
- Reported outcomes include knowledge, ethical awareness, self-efficacy, engagement, emotions, employability, and innovation.
